66314361	Rawipha Namthan	Gameplay demonstration and video editing.
66315481	Suwimon Khaengkasikit	Vocabulary preparation, development of gameplay power-ups, and testing.

1. Project Title

Sweet Word Garden is a web-based game developed to support English vocabulary learning through gameplay. It aims to help players retain English vocabulary and associate words with their Thai meanings.

2. Target Audience

The game is intended for Thai learners seeking to develop basic English language skills, including students who wish to practice vocabulary commonly used in everyday life.

3. Learning Objectives

1. To help players learn and retain English vocabulary used in everyday life.
2. To enable players to associate English words with their Thai meanings.
3. To provide an enjoyable and interactive language learning experience.
4. To encourage regular vocabulary practice through gameplay.

4. How to Play

1. Open the game and review the instructions.
2. Select a difficulty level appropriate to your proficiency.
3. Control the character to collect the English letters required to form the target word.
4. Refer to the Thai meaning and the feedback displayed in the game.
5. Continue playing to practice additional vocabulary.

5. Core Loop

The core gameplay loop involves selecting a difficulty level, collecting letters, forming English words, receiving feedback or rewards, and proceeding to the next word. This sequence is repeated to provide ongoing vocabulary practice.

6. Player Feedback

The game displays English vocabulary and the corresponding Thai meanings, together with feedback from the game system, to help players associate words with their meanings. The available difficulty levels allow players to select a level appropriate to their existing vocabulary knowledge.

7. Tools and Use of Artificial Intelligence

The following tools are used to develop the project:

- ChatGPT is used to assist with developing and refining code, categorizing vocabulary, and reviewing or improving translation-related systems.
- HTML, CSS, and JavaScript are used to implement the game's structure, visual presentation, and interactive features.
- GitHub Pages is used to publish the game as a website if the team selects this platform.

The project team verifies the content, vocabulary, and translations for accuracy. It also tests the game and reviews and improves the project before publication.
